Decision making

Neuroeconomics perspective:

- Economics, psychology, and neuroscience are converging today into a single, unified discipline with the ultimate aim of providing a single, general theory of human behavior - **neuroeconomics**.
- The goal of this discipline is to understand the processes that connect sensation and action by revealing the neurobiological mechanisms by which decisions are made.

Adopted from Glimcher&Rustichini, Science 2004

Neural correlates of social conformity

- **BOLD precursors**
- **Electrophysiological precursors of social conformity**

Conformity

- Some forms of social influence evoke conflicts of opinions.
- How do we change our opinion?

Solomon Asch found that the (genuine) participants conformed on 32% of the trials and only 26% of people never conformed (1951).

Definition

Conformity =

a type of social influence in which individuals change their attitudes, judgments, or behavior in order to adhere to existing **social norms**.

How do we update values/opinions based on social information?

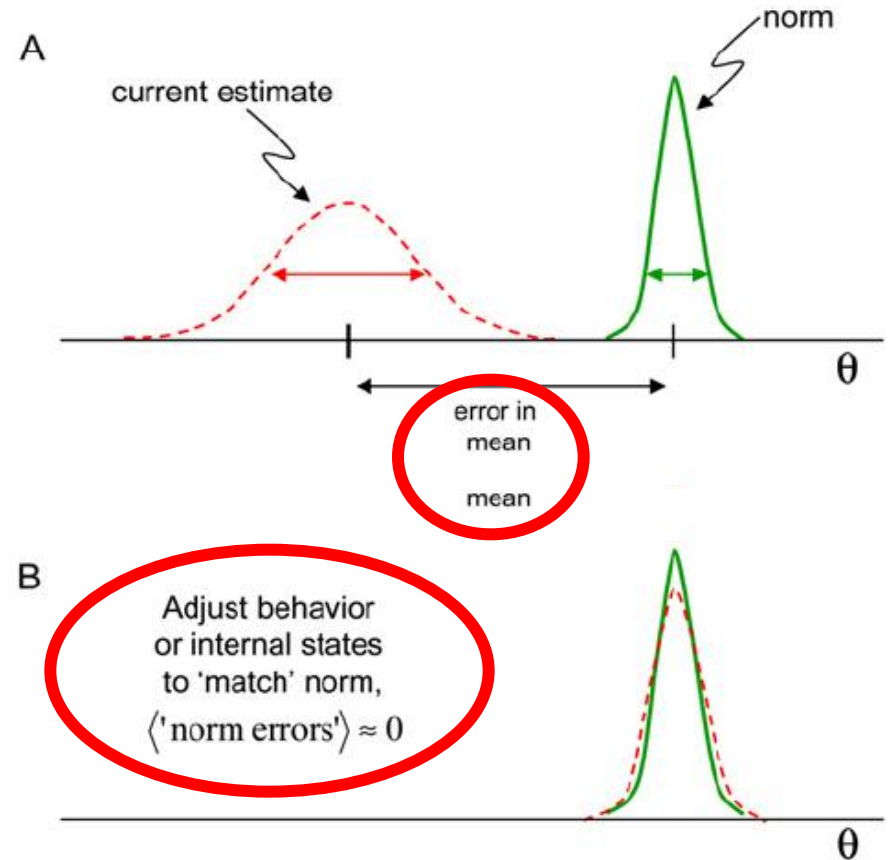

Learning mechanism of social influence

- Psychological studies emphasize the **rewarding value** of social approval or affiliation with others (Cialdini and Goldstein, 2004)
- Behavioral economics focuses more on the effects of **punishment for violating the norm** (Fehr and Fischbacher, 2004).
- Both approaches comply with a reinforcement learning mechanism: **social norms selectively reinforce certain behaviors.**

**How do we
detect
own violation
of Norms?**

Rescorla-Wagner model of classical conditioning

- The most intuitive way to learn to predict future reward and punishments is via error correction.
- The principle here is simple: make the best prediction you can, observe actual events and if your prediction was wrong, update your knowledge-base so that future predictions are more accurate.

Error detection as a component of Reinforcement learning models

- Neuroscience – the scientific study of the nervous system, a branch of biology.

Basal ganglia
These structures plan and initiate complex movement. Links to other parts of the brain (not shown) update the "motor program."

Thalamus

White matter

Gray matter

Cerebellum

Motor cortex

Brain stem

VOLUNTARY MOVEMENT

Stimulated by sensory neurons or by conscious thought and intention, the premotor cortex area (see The Brain Map on facing page) formulates a central motor program. This plan is sent to the motor cortex, which then sends instructions to voluntary muscles. As movement progresses, it is coordinated and continually updated by corrective nerve signals sent from the cerebellum, which also controls balance and the body's position in space.

Pathways used in precise movements of the hand

PATHWAY	SPECIALIZED FUNCTION
	Cortex sends motor message to muscle, resulting in movement
	Sensory cell in muscle (which monitors movement) sends signal to cerebellum
	Cerebellum sends corrective signals via thalamus to cortex to keep movement on course
	Cerebellum also sends message via spinal cord to muscle to correct muscle directly

http://faculty.fortlewis.edu/KENDALL_D/Physiology%20Web

The neuron can be modelled as a computational element which sums its inputs within its time-constant and, whenever this sum, minus inhibitory effects, exceeds a threshold, produces an action potential which propagates to all of its outputs.

Learning a reward value of stimuli

Hollerman and Schultz 1998 Nature Neurosci

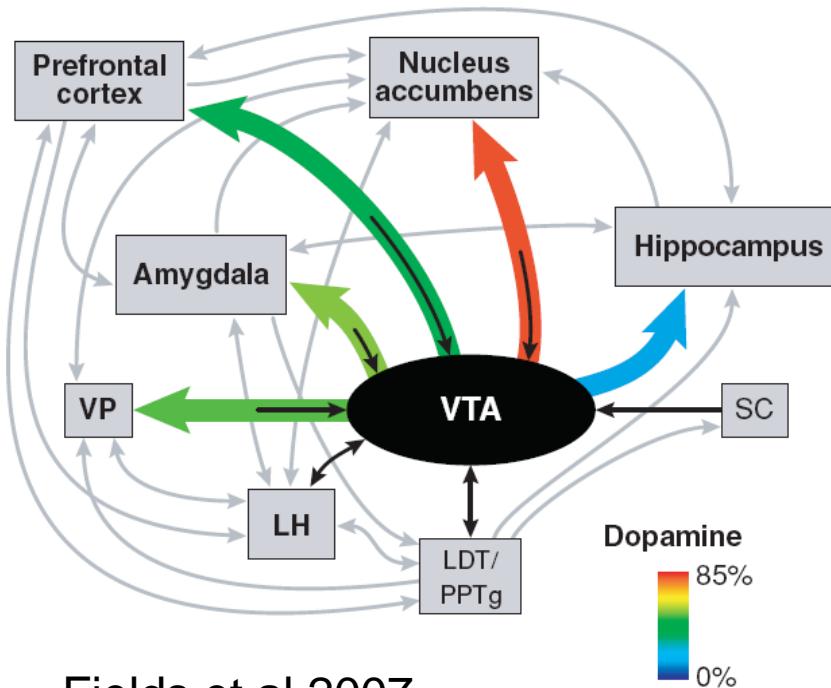

Hollerman and Schultz 1998 Nature Neurosci

- Learning a reward value of stimuli

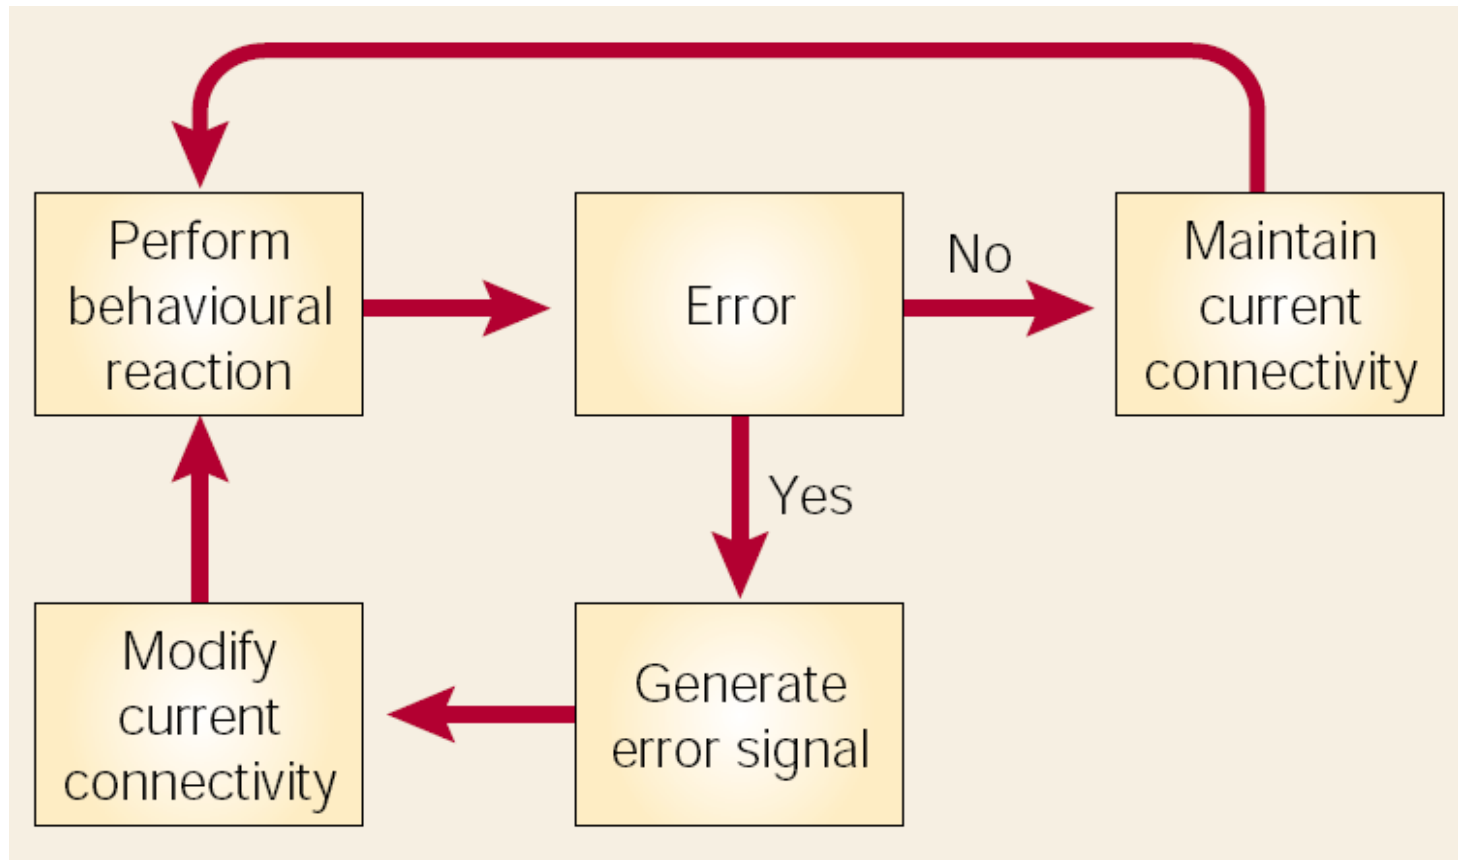

Fields et al 2007

Dopamine response = Reward occurred – Reward predicted

Prediction error – the discrepancy between an actually received reward and its prediction.

Learning is proportional to the prediction error.

NATURE REVIEWS | **NEUROSCIENCE**
VOLUME 1 | DECEMBER 2000

Role of Dopamine

The anhedonia hypothesis.

- Rewards are usually associated with a subjective feeling of pleasure or euphoria. The anhedonia hypothesis (Roy Wise, 1978) posits that dopamine is important for this pleasure.
- **N.B.** Brain imaging studies have indicated that stimulant-induced euphoria is loosely correlated with the degree of drug-induced dopamine release.
- On present evidence, it seems best to suggest that elevations in brain dopamine are only loosely correlated with subjective pleasure.

Reward-prediction theory of dopamine

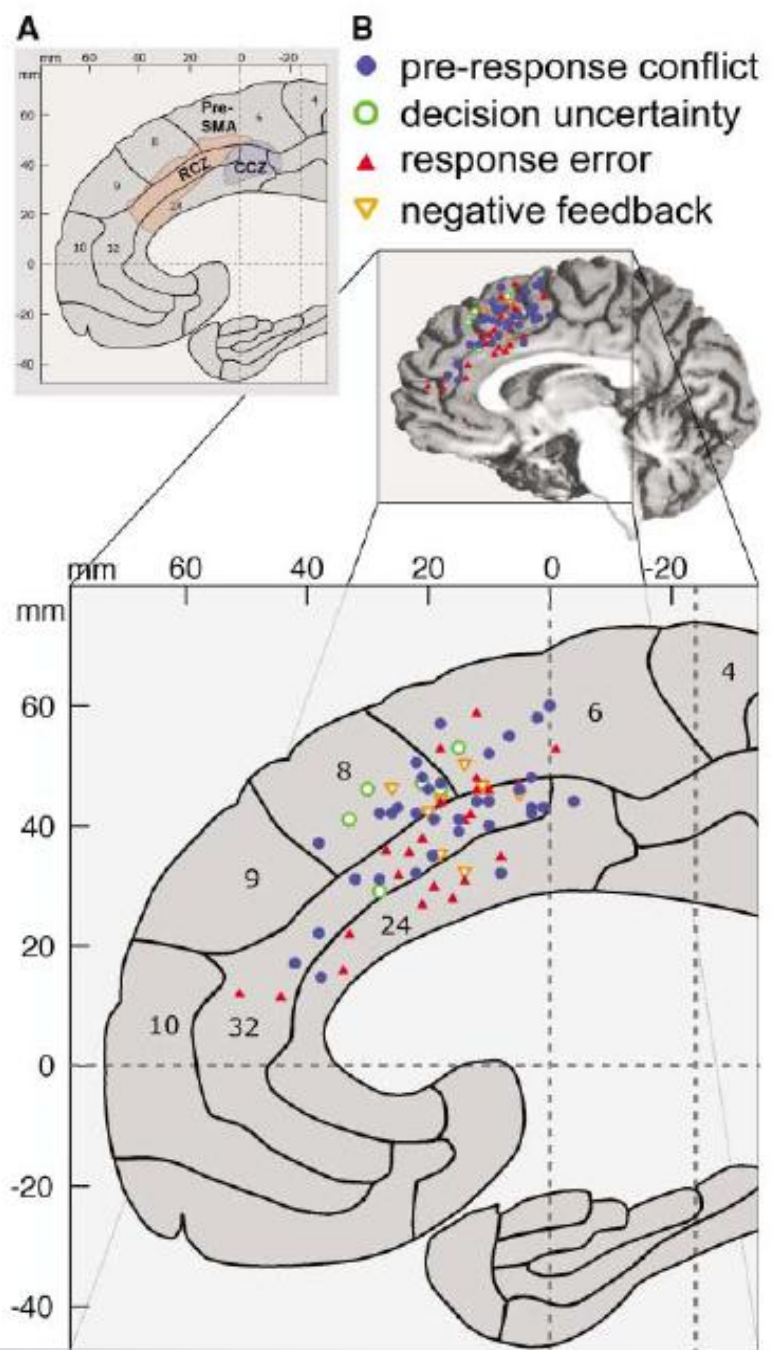

- Dopamine neurons report rewards relative to their prediction rather than signaling primary rewards unconditionally...
 - The dopamine response is positive (activation) when primary rewards occur without being predicted.
 - The response is nil when rewards occur as predicted.
 - The response is negative (depression) when predicted rewards are omitted.
- These characteristics have been demonstrated repeatedly for midbrain dopamine neurons. Indeed, the presentation of a predictive cue elicits a burst of activity from these neurons, the size of which is proportional to the magnitude, probability and even delay of the predicted reward

Working Hypothesis

- Does social influence modulate our opinions using the same fundamental mechanisms and neural networks that underlie reinforcement learning?

Results:

- Down-regulation of the RCZ suppresses subjects' conformal behavior.
- Overall, results show that social conformity complies with the principles of the reinforcement learning.

Conclusions

- ✓ The RCZ is an important target of social influence.
- ✓ TMS of the medial prefrontal cortex reduces social influence on our judgments.
- ✓ Our results support the hypothesis that social influence (including peer group influence, advice taking, cognitive dissonance, etc.) is underlined by the general reinforcement learning mechanism.

Social conformity:

why is it so difficult to be different?

TELE2

Why? RICHARD DAWKINS: The Selfish Gene.

- An **evolutionarily stable strategy** – a strategy which, if most members of a population adopt it, cannot be bettered by an alternative strategy.
- “best strategy for an individual depends on what the majority of the population are doing.”
- Since each individual is trying to maximize his own success, the only strategy that persists will be one which, once evolved cannot be bettered by any deviant individual.
- ... selection will penalize deviation from it.

Wisdom of the crowd

Francis Galton
1822 –1911

Distribution of the estimates of the dressed weight of a particular living ox, made by 787 different persons.

Degrees of the length of Array 0—100	Estimates in lbs.	* Centiles		Excess of Observed over Normal
		Observed deviates from 1207 lbs.	Normal p.e. = 37	
5	1074	- 133	- 90	+ 43
10	1109	- 98	- 70	+ 28
